CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB This invention related generally to methods of detecting and quantifying biomarkers of oxidative stress in proteins. The biomarker may be any amino acid that has undergone oxidation (or other modification, e.g. chloro-tyrosine, dityrosine). Emphasis is given herein on oxidized sulfur- or selenium-containing amino acids (SSAA). The biomarker of oxidative stress in proteins may be detected with an antibody that binds to oxidized amino acids, specifically oxidized sulfur- or selenium-containing amino acids. The antibody may be monoclonal or polyclonal. The presence of biomarker or amount of biomarker present in a sample may be used to aid in assessing the efficacy of environmental, nutritional and therapeutic interventions, among other uses.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

DRWD FIG. 15 shows PAoxOVA ELISA for plasma samples from 47 patients undergoing renal dialysis in the course of management of end stage renal disease.

DETD . . . the methodology. MSA may also be used that does not contain the antioxidant 3-(2-aminoethyl)indole. The sodium salt of 2-mercaptoethanesulfonic acid (MESNA) is added (as high as 48 mM final concentration) to all protein samples prior to hydrolysis. Addition of MESNA suppresses the conversion of intermediate oxidation products of cysteine/cystine to cysteic acid. MESNA

has no effect on the recovery of cysteic acid as judged by the quantitative recovery of an added cysteic acid standard. MESNA is also used in place of N-acetyl-L-cysteine in the orthophthalaldehyde derivatization reaction. As a result, one does not obtain the. . .

DETD Patients undergoing renal dialysis. Plasma samples were obtained from 47 patients undergoing renal dialysis in the course of management of end stage renal disease. These samples were diluted 1:200 and examined in the PAoxOVA ELISA for the presence of endogenous antibody to ODP. The. . .
